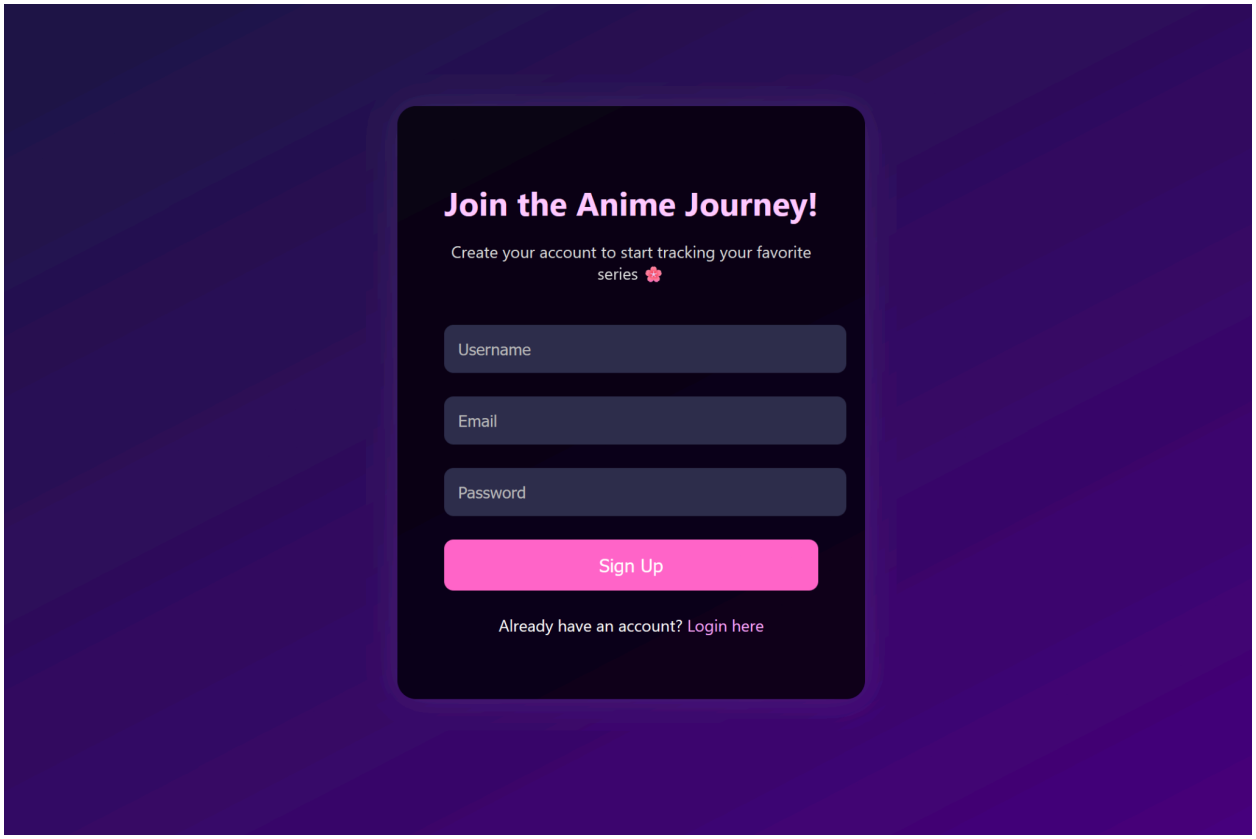
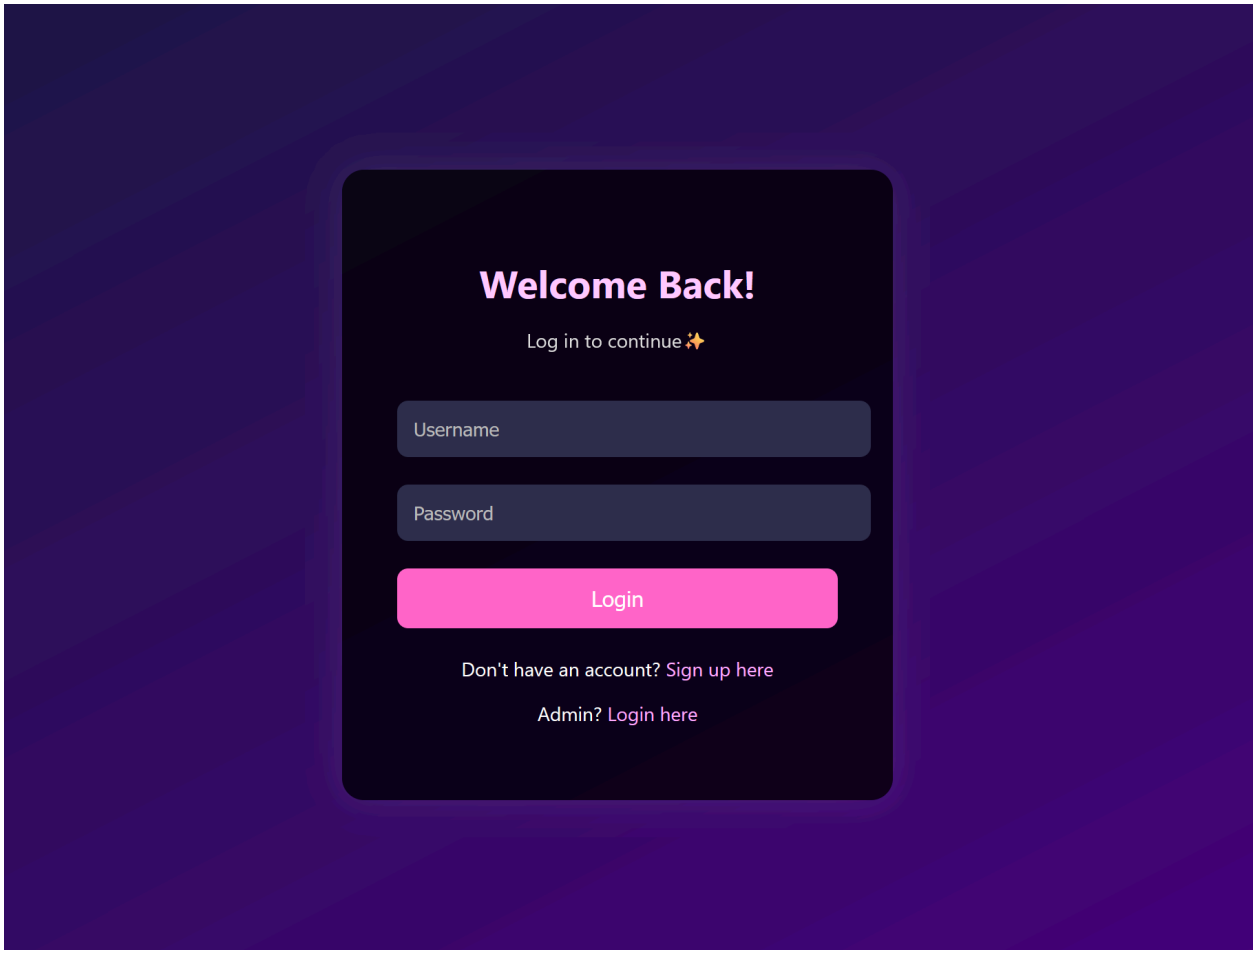
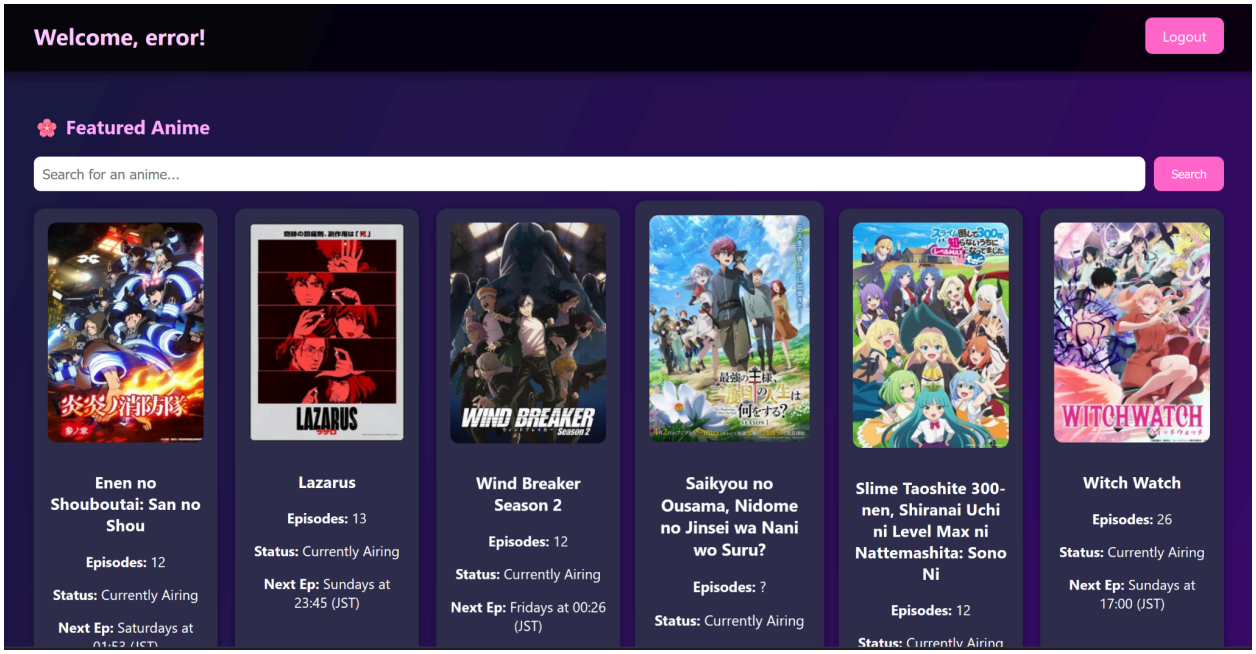
Starting with the sign-up, the sign-up page provides new users with a straightforward and secure way to create an account on the anime tracker web app. The form collects essential user information such as username, email, and password, with validation in place to ensure proper input. For security purposes, we use password hashing and a database protection mechanism to make sure that the info stored is not in plain text.



With our login page, we kept it simple. There is login for users and a login for admins. PHP handles the server-side authentication logic, verifying users' input to the data stored in the database.



After the user logs in, they will be met with the dashboard. This is where the user is going to see their Anime list that shows new seasons that have been released. They will also be able to search for the anime they are looking for and log out with ease. We are using the Jikan API to fetch newly released seasons in real time.



Moving onto the admin page, This is pretty straight foward.
